

Sherod Taylor

Platform Engineering Manager @ Bloomberg

New York, NY

✉ sherodtaylor@gmail.com 🌐 www.sherodtaylor.dev 🐙 github.com/sherodtaylor 🔗 linkedin.com/in/sherodtaylor

Platform Engineering Manager at Bloomberg. I lead two teams (10 engineers) building AI tooling for the platform 9,000+ engineers ship on daily. 12+ years turning infra into leverage. Off-hours: three Claude Code agents in a home lab that open and review their own PRs.

Leadership Project Management Product Design

Experience

Platform Engineering Manager

March 2023 - Present

Bloomberg LP · New York, NY

Two teams, 10 engineers, building AI tooling for the internal developer platform that 9,000+ engineers ship on daily. Focus: making our APIs callable by AI agents end-to-end.

- Lead two engineering teams (10 people) – AI platform tooling and the internal developer platform
- Bridged the platform's API surface to agentic developer tools: identity, gateway, and libraries so AI agents authenticate as first-class clients alongside humans
- Founded the team's microfrontend framework (Vite + Module Federation) – product teams self-serve onto the platform with auth, deployment, and shared UI primitives baked in
- Coach engineers to work ahead via POCs in the margin – surface real constraints, graduate the work into the roadmap with known tradeoffs
- Stay hands-on in the codebase – model the working-ahead instinct I expect from the team

Technologies: Go · TypeScript · React · Module Federation · Kubernetes · Observability · Python · AI / LLM tooling

Senior Software Engineer

August 2018 - March 2023

Bloomberg LP · New York, NY

Founding engineer on Bloomberg's internal infrastructure provisioning platform. Grew into a tech-lead role while staying in the codebase.

- Founding engineer – designed the allocation lifecycle state machine, API-level observability, and the workflow analytics stack the team used to define

SLOs and capacity

- Built the platform's unified API gateway – single contract for managed infrastructure regardless of the underlying system
- Shipped the API observability layer (per-endpoint metrics, per-team SLO dashboards, runtime-switchable) before the team had any
- Grew into tech-lead – modeled the working-ahead instinct that became how the team operates

Technologies: Python · Go · JavaScript · React · Node.js · Module Federation · GraphQL · Observability · Kubernetes

Senior Software Engineer

April 2015 – August 2018

Paxos (formerly itBit) · New York, NY

Led infrastructure modernization and REST API platform development. Designed SWIFT banking system integration and implemented zero downtime deployments.

- Completed full Terraform migration of manually deployed systems
- Designed and implemented TLS client certificate authentication
- Led REST API platform development for institutional trading
- Designed SWIFT banking system for institutional trading integration
- Implemented zero downtime deployments using HA Proxy
- Proposed framework using Node.js, React.js, and Flux architecture
- Contributed to becoming second-largest Bitcoin exchange by volume

Technologies: Node.js · React.js · Terraform · Docker · PostgreSQL

Software Engineer

September 2013 – May 2015

Madison Reed · San Francisco, CA

Implemented Redis caching system, developed custom CMS, and led migration from Magento to custom Node.js framework.

- Implemented Redis caching system reducing database calls
- Developed custom CMS tailored to company workflow
- Led migration from Magento to custom Node.js order processing framework

Technologies: Node.js · Redis · MongoDB · JavaScript · CSS

Skills

Frontend Development

12+ years

React · Angular · Next.js · TypeScript · JavaScript · Tailwind CSS · Vite · Webpack · Module Federation

Backend Development

12+ years

Node.js · TypeScript · Go · Python · PostgreSQL · Redis · GraphQL · Apache Kafka · Apache Airflow · Event Sourcing · API Integration

DevOps & Infrastructure

10+ years

Docker · Git · Terraform · Packer · Proxmox · OpenStack · Networking · TrueNAS · Kubernetes

Leadership & Strategy

4+ years

Leadership · People Management · Project Management · Product Strategy · Design Thinking · Mentoring

Projects

agent-smith

<https://github.com/sherodtaylor/agent-smith>

Autonomous AI engineering teammates running in a home-lab Kubernetes cluster. Matrix is the input. Tag a bot, it opens a PR; tag another, it reviews. They never hold real credentials – those stay behind an egress proxy. Public Helm chart.

🌐 Framework docs: <https://sherodtaylor.github.io/agent-smith>

- Three agents, one image: DevBot (code), InfraBot (k3s/Flux), PMBot (product/PRDs) run as separate StatefulSets from the same parametric image. Per-agent persona is a directory under agents/<name>/
- Matrix-driven PR workflow: messages in #dev / #infra are real Claude Code prompts. Author opens a PR; the other agent reviews and posts inline findings. A Stop-hook re-wakes the author on unaddressed comments – iteration without a human in the loop
- Egress credential firewall (iron-proxy): agents never hold real GitHub or Anthropic tokens. iron-proxy MITMs egress and swaps placeholders for real creds per-host against an allowlist. A compromised pod leaks nothing useful
- MCP for the cluster's own observability: VictoriaMetrics, VictoriaLogs, NATS, and the Matrix channel are all MCP servers. 'Check the api-latency dashboard' is one prompt
- Public OSS: image at ghcr.io/sherodtaylor/agent-smith, Helm chart at oci://ghcr.io/sherodsmith

Claude Code, MCP, AI Agents, Matrix, NATS, k3s, Flux GitOps, Helm, iron-proxy, Bun, Go, Docker, tmux, GitHub Actions

SpareCoins

<https://github.com/sherodtaylor/sparecoins>

A crypto investment mobile application that rounds up spare change from everyday transactions and automatically invests it in cryptocurrency. Think Acorns for crypto – democratizing crypto investing through micro-investing with seamless bank integration.

- Automated Crypto Investing: Connects to bank accounts to round up transaction spare change and automatically purchases cryptocurrency through Coinbase exchange integration
- GraphQL-First Architecture: Built robust backend API using Golang, GraphQL, and Echo framework with OAuth authentication. Generated type-safe client

code using GraphQL codegen for seamless frontend integration

- Rich Mobile UX: Developed React Native frontend with Apollo GraphQL for data fetching. Created engaging user experience with custom Lottie animations for transaction flows, account linking, and investment progress visualization
- Financial Integration: Implemented secure bank account connectivity using Plaid API for real-time transaction monitoring with automated round-up calculations and crypto purchase execution

React Native, Golang, GraphQL, Apollo, Lottie, OAuth, Echo, Plaid, Coinbase API, FinTech

Home Lab Cluster

<https://github.com/sherodtaylor/homelab>

Self-hosted k3s cluster running every app my family depends on. Flux reconciles from one git repo, ExternalSecrets pulls creds from Infisical, VictoriaMetrics + VictoriaLogs catch drift. Family-grade, GitOps-managed.

- Media + photos + files: Jellyfin, Plex, Immich (face-recognition over years of family photos), Nextcloud, Audiobookshelf – all running on the cluster, backed by TrueNAS NFS
- Home Automation: Home Assistant – lights, thermostats, schedules, sensors – on the same cluster, not a separate appliance
- Observability built-in: every pod's metrics and logs land in VictoriaMetrics / VictoriaLogs. Grafana + Alertmanager catch regressions before they become outages
- GitOps all the way down: Flux reconciles every Kustomization and HelmRelease. cert-manager + kubernetes-replicator handle TLS. The cluster rebuilds from a single git push

Proxmox, k3s, Flux GitOps, Helm, Traefik, cert-manager, ExternalSecrets, Infisical, TrueNAS, Home Assistant, Jellyfin, Plex, Immich, Nextcloud, Audiobookshelf, Sonarr, Radarr, Prowlarr, qBittorrent, VictoriaMetrics, VictoriaLogs, Grafana, Alertmanager, Let's Encrypt

Dotfiles

<https://github.com/sherodtaylor/dotfiles>

Maintained comprehensive dotfiles and development environment configurations for consistent, reproducible development setups across multiple systems.

- Cross-Platform Configuration: Unified development environment setup for macOS and Linux systems
- Editor Configuration: Advanced Neovim configurations with language servers and productivity enhancements

Neovim, Zsh, Git, Tmux, Shell, macOS, Linux, Docker

Community & Leadership

Bloomberg Diversity Interview Prep Bootcamp

Mentorship

Volunteer Instructor & Mentor • 6-month program

A comprehensive bootcamp program designed to train underrepresented candidates for technical interviews through mentoring and hands-on training from Bloomberg engineers. Provides 1:1 guidance, curriculum development, and mock interview preparation.

- Designed and delivered Systems Design curriculum
- Took on 1:1 mentee and prepared them for coding interviews
- Provided weekly mock interviews and detailed feedback sessions
- Followed training schedule for 6 months: algos, system design, coding interviews

Bloomberg Community Service Leadership

Volunteer

Community Service Leader • Ongoing

Leading community service initiatives within Bloomberg engineering teams, organizing volunteer activities and coordinating outreach programs to support local NYC communities.

- Logged 15+ volunteer hours in past year
- Mobilized multiple engineering teams for community service
- Coordinated homeless aid initiatives and care package distribution
- Organized NYC park cleanup efforts
